

**Amendments to the Claims:**

Please cancel claims 20, 21 and 24, and amend claim 23 as shown in the following listing of claims. This listing of claims will replace all prior versions, and  
5 listings, of claims in the application.

- 1 1. (previously presented) An apparatus for optical navigation comprising:  
2 a surface comprising an aperture, said surface configured to be  
3 moveable against an illuminated surface having a detectable texture;  
4 an optical motion detection circuit integral to said apparatus and  
5 optically coupled to said detectable texture of said illuminated surface, said optical  
6 motion detection circuit comprising a single detector for acquiring images of said  
7 illuminated surface at a specified rate, said detector acquiring a single image at a  
8 time, and comprising an image processor producing motion signals indicative of  
9 motion of said surface relative to said detectable texture of said illuminated  
10 surface, wherein said motion signals are produced by comparing two said images  
11 and comprise a change in location in a first axis and a change in location in a  
12 second axis, wherein said optical motion detection circuit is operable to detect  
13 said detectable texture without requiring an integral illumination source;  
14 an internal interference reduction light source integral to said  
15 apparatus and proximate said aperture, said interference reduction light source  
16 operable to provide interference reducing illumination onto said illuminated  
17 surface in response to said optical motion detection circuit detecting interference  
18 caused by an illumination from said illuminated surface; and  
19 an optical filter operable to filter said illumination and receive said  
20 interference reducing illumination such that said optical motion detection circuit  
21 can detect said detectable texture in the event of interference caused by said  
22 illumination.

1     2.        (original) The apparatus as recited in Claim 1 further comprising an optical  
2     element integral to said apparatus, said optical element proximate said aperture  
3     and receiving light from said detectable texture of said illuminated surface, said  
4     optical element operable to optically couple said optical motion detection circuit  
5     integral to said detectable texture of said illuminated surface.

1     3.        (canceled).

1     4.        (original) The apparatus as recited in Claim 1 further comprising a  
2     supplemental light source operable to provide additional illumination onto said  
3     illuminated surface in response to said optical motion detection circuit detecting  
4     insufficient illumination of said illuminated surface.

1     5.        (original) The apparatus as recited in Claim 1 further comprising an  
2     internal power source for providing power to said apparatus.

1     6.        (original) The apparatus as recited in Claim 1 wherein said illuminated  
2     surface is a cathode ray tube and wherein said detectable texture is a shadow mask  
3     of said cathode ray tube.

1     7.        (original) The apparatus as recited in Claim 1 wherein said illuminated  
2     surface is a liquid crystal display and wherein said detectable texture is a diffuser  
3     plate of said liquid crystal display.

1     8.        (original) The apparatus as recited in Claim 1 wherein said illuminated  
2     surface is a liquid crystal display and wherein said detectable texture comprises  
3     pixels of said liquid crystal display.

1     9.        (original) The apparatus as recited in Claim 1 wherein said illuminated  
2     surface is overlaid with a semi-transparent layer comprising said detectable  
3     texture.

1 10. (original) The apparatus as recited in Claim 9 wherein said semi-  
2 transparent layer comprises unique positioning information providing absolute  
3 position information of said apparatus relative to said illuminated surface.

1 11. (previously presented) An electronic device for optical navigation on a  
2 display screen, said electronic device comprising:

3 a surface comprising an aperture, said surface configured to be  
4 moveable against a display screen having a detectable texture when illuminated;  
5 an optical element integral to said electronic device, said optical  
6 element proximate said aperture and receiving light from said detectable texture  
7 when illuminated;

8 an optical motion detection circuit integral to said electronic device  
9 and optically coupled by said optical element to said detectable texture of said  
10 display screen, said optical motion detection circuit comprising a ~~an~~ single  
11 detector for acquiring images of said display screen at a specified rate, said  
12 detector acquiring a single image at a time, and comprising an image processor  
13 producing motion signals indicative of motion of said surface relative to said  
14 detectable texture of said display screen when illuminated, wherein said motion  
15 signals are produced by comparing two said images and comprise a change in  
16 location in a first axis and a change in location in a second axis, wherein said  
17 optical motion detection circuit is operable to detect said detectable texture  
18 without requiring an integral illumination source;

19 a supplemental light source integral to said electronic device and  
20 proximate said aperture, said supplemental light source operable to provide  
21 additional illumination onto said display screen in response to said optical motion  
22 detection circuit detecting insufficient illumination of said display screen and  
23 operable to provide interference reducing illumination onto said display screen in  
24 response to said optical motion detection circuit detecting interference caused by  
25 an illumination from said display screen; and

26 an optical filter operable to filter said illumination and receive said  
27 interference reducing illumination such that said optical motion detection circuit  
28 can detect said detectable texture in the event of interference caused by said  
29 illumination.

1     12.     (canceled).

1     13.     (original) The electronic device for optical navigation on a display screen  
2     as recited in Claim 11 further comprising an integral power source for providing  
3     power to said electronic device.

1     14.     (original) The electronic device for optical navigation on a display screen  
2     as recited in Claim 11 wherein said detectable texture is a shadow mask of a  
3     cathode ray tube.

1     15.     (original) The electronic device for optical navigation on a display screen  
2     as recited in Claim 11 wherein said detectable texture is a diffuser plate of a liquid  
3     crystal display.

1     16.     (original) The electronic device for optical navigation on a display screen  
2     as recited in Claim 11 wherein said detectable texture are pixels of a liquid crystal  
3     display.

1     17.     (original) The electronic device for optical navigation on a display screen  
2     as recited in Claim 11 wherein said display screen is overlaid with a semi-  
3     transparent layer comprising said detectable texture.

1     18.     (original) The electronic device for optical navigation on a display screen  
2     as recited in Claim 17 wherein said semi-transparent layer comprises unique  
3     positioning information providing absolute position information of said electronic  
4     device relative to said display screen.

1     19.     (canceled).

1     20.     (canceled).

1     21.     (canceled).

1     22.     (previously presented) A method for optical navigation on an illuminated  
2     surface using an electronic device, said method comprising:  
3                 acquiring a first frame from said illuminated surface at a single  
4     detector of said electronic device, such that said electronic device does not require  
5     an internal illumination source to provide illumination to said illuminated surface;  
6                 acquiring a second frame at said single detector from said  
7     illuminated surface;  
8                 determining a change in position in a first axis and in a second axis  
9     of said electronic device relative to said illuminated surface based on said first  
10    frame and said second frame,  
11                wherein said determining a change in position comprises;  
12                computing correlation values for said first frame and said second  
13    frame, said correlation value indicating movement of said electronic device from  
14    said first frame to said second frame;  
15                predicting a shift in position from said first frame based on said  
16    correlation values; and  
17                outputting a motion signal indicating said shift in position, said  
18    method further comprising:  
19                determining whether illumination provided by said illuminated  
20    surface interferes with said acquiring said first frame;  
21                provided said illumination provided by said illuminated surface  
22    interferes with said acquiring said first frame, providing interference reducing  
23    illumination onto said illuminated surface; and  
24                filtering said illumination such that said electronic device can  
25    acquire said first frame using said interference reducing illumination.

1     23.     (currently amended) A system for optical navigation comprising:  
2                     a display screen including a self-illuminated surface having a  
3     detectable texture; and  
4                     an optical screen navigation device comprising:  
5                     a surface comprising an aperture, said surface configured to  
6     be moveable against said self-illuminated surface of said display screen; ~~and~~  
7                     an optical motion detection circuit configured to produce  
8     motion signals indicative of motion of said surface relative to said detectable  
9     texture of said self-illuminated surface, wherein said optical motion detection  
10    circuit is operable to detect said detectable texture without requiring an integral  
11    illumination source;  
12                     an internal interference reduction light source operable to  
13    provide interference reducing illumination onto said self-illuminated surface in  
14    response to said optical motion detection circuit detecting interference caused by  
15    an illumination from said self-illuminated surface; and  
16                     an optical filter operable to filter said illumination and  
17    receive said interference reducing illumination such that said optical motion  
18    detection circuit can detect said detectable texture in the event of interference  
19    caused by said illumination.

1     24.     (canceled).
